

DEFOLADE

Defoliation Synergist

DEFOLADE is a proprietary formulation of superior organosilicone surfactants, and plant uptake synergists that is designed for use with defoliation and desiccant products.

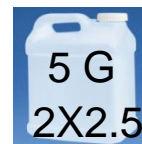

At the time when cotton defoliant are applied, the plants are generally in a state of senescence, and defoliant compounds have difficulty in the absorption process. This leads to poor results and often requires more than one application of the defoliant or desiccant to achieve results.

DEFOLADE works in the following ways to assure maximum utility of the applied defoliant or desiccant:

- Organosilicone surfactant components insure thorough crop coverage.
- Uptake synergists insure rapid and complete uptake of defoliant or desiccant compounds even if crop is well into decline.

**FOR USE WITH ALL DEFOLIANTS,
DESSICANTS, AND HARVEST AID
PRODUCTS**

EXCEPT SODIUM CHLORATE.
