

DROP ZONE

DROP ZONE is a proprietary formulation used to insure precision spray deposition aid & spray drift retardant. DROP ZONE uses long chain polymers that increases the viscosity of the spray mixture which results in a courser spray.

- Reduces spray vortices
- Controls drifts
- Works by increasing the viscosity of the spray mixture, which increases the number of coarser droplets
- Reduction of spray volume contained in droplets smaller than 100 microns.

Drift of pesticides can be influenced not only by application conditions and vegetation near the target area, but by the nature of the pesticide itself. Many pesticides are more susceptible to drift than others. Pesticide drift is never an accident use common sense and sound application technology. DROP ZONE will retard drift significantly but will not totally eliminate it.
