

MITIGATE-S for Crop Stress Mitigation

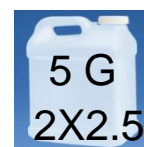

MITIGATE-S is a unique formulation of plant nutrients that are combined in a way that yields a product with a highly negative charge. It also incorporates a proprietary natural biostimulant that is heavy in Cytokinin like influence on the crop.

MITIGATE-S is particularly effective in reducing lint production loss on cotton due to environmental stresses. Cotton under stress loses the ability to produce increased lint. University studies show that the yield potential in cotton is compromised at temperatures far lower than has been realized.

When applied to stressed cotton the acidic formulation cuts through leaf waxes where its negatively charged ions are quickly drawn into the crop by the positively charged ions in the crop itself.

NO OTHER PRODUCT LIKE IT

- Phosphorous content provides essential crop energy
- Calcium content helps to mitigate crop respiration stress, and provides for continued cell division
- Cytokinin like components delay and offset the natural senescence associated with crop stress
