

CORN PROGRAM

Because of the narrow window of application opportunity, this is perhaps the simplest of all program.

- **SEED TREATMENT:** Because most corn seed are purchased already treated with a fungicide and or insecticide, and in some cases both, the primary treatment will be **KIIK-Plus Talc** in field.
- **In the corn belt** you may find that corn seed are delivered to the farm in bulk trailers with augers. There may be the opportunity to apply the talc as the seed are arrgered into the planter.

NOTE: At some point, and because **KIIK** liquid is compatible with fungicides and insecticides, you may be able to sell it to seed suppliers to be applied along with the pesticides.

- **FOLIAR PROGRAM:** The only real window of Opportunity to enhance yield with a foliar is between the 3 and 7 blade stage. Apply **Aamaiz-32** at this stage.
