

PEANUT PROGRAM

SEED TREATMENT: **KIIK PLUS** will always be used on peanuts because of the way they are handled. In peanut areas such as Alabama & Georgia there will be seed processing plants that apply fungicides to the seed Peanuts. If you can find a way to get the dry talc mixed with the soluble powder fungicide, they can be applied at the same time.

NOTE: When the **KIIK Talk** is to be mixed with the powdered fungicide there may be a question of too much volume. In this instance **KIIK PLUS** can be specially formulated to where the volume can fit in.

EARLY SEASON FOLIAR: To push crop development utilize **CROP POWER-47** at any time after first true leaves up to just prior to pegging.

AT PEG DOWN: At around 30 days after pegs begin to initiate from lateral branches apply 1.0 pt./Acre **PEGASUS** and repeat at about 70 days.
