

## Tomatoes and Peppers

Although tomatoes require the most attention by far their program approach is very similar from the product application standpoint.

- **Transplanting:** Both crops are transplanted to the field do the following products will be of real benefits.
  - **Transplant Starter:** primarily used in transplant water at 1-2 quarts per 100 gallons of transplant water.
  - **Organic Matter:** used in transplant water at 3-4 quarts per 100 gallons of transplant water.
- **Early Foliar Spray:** **Crop Power-47** for early application is the ideal choice. Apply from one week after field set up to bind stage when **Poblano Pro** applications begin.
- **Fruiting Sprays:** **Poblano Pro** will be your choice on both tomatoes and peppers with the first spray coming from bind to early bloom.
- **Determinate Tomatoes:** These are mostly grown for mechanical harvesting (cammers). Characterized by a big single flush of blooms. Here you want to apply **Poblano Pro** at landing stage and repeat in a week or 10 days. You would be advised to apply **ENZROT** also just as the small tomatoes begin to form.
- **Indeterminate Tomatoes:** Begin **Poblano Pro** applications on same schedule. Timing as determined above. Repeat every 10 days throughout season.
- **Peppers (all types):** Treat as with indeterminate tomatoes.
