

PENETRAR liquid is a liquid soil surfactant that is specifically designed to facilitate the movement of water down through the soil profile in areas where water penetration is a problem, compacted areas, berms and gallery areas, anywhere water does not go down into the soil well, or in sufficient quantity with rainfall or irrigation. **PENETRAR** is also a very valuable addition to flushing operations on golf greens and tees when applied prior to the flushing cycle. It also has very good rewet characteristics meaning that even if it is not immediately moved very deep into the soil profile initially, it will continue to move water on subsequent watering. There is no phytotoxicity from the product to either the apical plant parts or to the roots, and it can be used at very high temperatures without evaporation of the active ingredients. It has been used at temperatures as high as 110 degrees Fahrenheit. It is combined with water and sprayed directly onto the turf.

BEST RESULTS WILL BE REALIZED WHEN THE PRODUCT IS WATERED INTO THE SOIL SLIGHTLY WITHIN 2-3 HOURS OF APPLICATION.
