

Cal Pal PELLETS are solid cylinders composed of soil penetrating surfactants, proprietary organic acids, and soluble calcium. Individual cylinders each weigh 250 grams, and they are placed in hose end sprayers where the active ingredients are applied during syringing operations. This is a most convenient way to apply critical needs during stress periods on the turf. The calcium in the product is pre-reacted with the organic acids to prevent tie up on contact with the soil. Calcium is a priority nutrient in stress periods, and is of particular importance when sodium and bicarbonates from irrigation sources are a problem.
