

REVEILLE-GSGE is a “GRASS SEED GERMINATION ENHANCER”
REVEILLE-GSGE contains a wide array of nutrients that are needed in the germinations and establishment phases of all turf grasses. These nutrients are sequestered in organic acids (chelated) to prevent soil tie up.

Talc and other organic compounds induce rapid water imbibition by the seed by actually drawing water to the seed.

Naturally occurring biostimulant compounds perform several important functions in turf grass establishment.

- Rabid Dormancy Break and Germination
- Reduced Seeding Mortality due to Low Vigor Seed.
- Vigorous Fast Growing Seedlings
- Prolific Root Systems
